

Amazon Web Services (AWS)

The three main services provided are:

1. IAM (Identity and Access Management)
2. EC2 (Elastic Compute Cloud)
3. S3 (Simple Storage Service)

IAM (Identity and Access Management)

- **Root User** – The user account that is created when we first sign up.
- Inside the root user, we can create multiple sub-users using the IAM service.
- The main role of IAM is to create new users and grant access permissions.
- The root user can monitor and manage all IAM users.
- First, we can create a group, and inside the group we can add multiple users.

Multi-Factor Authentication (MFA)

- Used for extra security.

EC2 (Elastic Compute Cloud)

- Used to create and manage virtual machines (called instances).

S3 (Simple Storage Service)

- Provides scalable (elastic) storage.
- Used for storing and retrieving data.
- In Google Drive, we can store 15 GB of data for free, but in S3 we can store only 5 GB of data for free.
- In S3, data is stored in containers called buckets.
